Here is the use case diagram for my system the user can ask question and answer the questions. The user is going to answer the questions that the system asks and the user questions that the system did not know the answer. On the other hand the system is going to ask questions and try to answer the questions that the user asks. If there are questions that the system cannot answer it will remember the answer can ask for the answer and remember the answer. The system can also detect swear words. If the user swear at the system it will know and reply accordingly. The system can also detect spelling and grammatical error. The system will not understand sentences which has too much error.
